Open communication interface (OData)
G-Core/OpenData

G-Core/OpenData

Software option to connect ERP and database systems providing data via the OASIS-certified Open Data Protocol (OData) to a G-ST system based on G-Core. Communication takes place via http. Using this interface, event data can be extended to include assigned data from, for example, an ERP system. These can be stored as meta data in the G-Core database and can be used for fast searches of events and video sequences. For example, the order number, the addressee and the transport company can be determined for a scanned package number and displayed in the image of the scanning process. All scanning processes for a shipping order can then be found quickly for later evaluation. Applicable as of G-Core version 2.2.2.184.

Turnkey delivery and installation or turnkey assembly and connection

Model: G-Core/OpenData
Brand: Geutebrück or similar
